Indoor Air Quality Monitoring & Analysis

Canadians spend, on average, 90% of their time indoors and yet we have no idea if the air we breathe contains anything harmful. The particles may be too small to see but may actually be affecting your health.

Asthma, allergies and other respiratory illnesses can be caused by hazardous substances in the air. That's why AmeriSpec offers Indoor Air Quality Monitoring & Analysis, providing results and recommendations for total peace of mind.

Unseen dangers

Even those who keep an impeccably clean home may still have potentially dangerous particles circulating in the air. These range from very minor irritants like dust and animal dander to major ones such as molds and chemical vapours created by building materials or furnishings.

No need to live in fear though. There's a very simple way to know the condition of the air quality in your building.

Just book an **Indoor Air Quality Service** with AmeriSpec. Our professional, certified inspectors will provide the same high level of quality service we've become known for when performing home inspections.

AmeriSpec will conduct a thorough investigation of all environmental threats within the home:

- Indoor air quality, including airborne particles & airborne chemicals
- Mold
- Asbestos
- Lead
- Radon

There are many unseen threats to your health. Some buildings and homes can contain lead in paint and plumbing, or asbestos building materials, as well they can be challenged with mold due to older construction methods.

Newer homes can often have very poor air quality. With so much focus on energy efficiency new homes are often starved for fresh air, greatly deteriorating the air quality and the health benefits of clean indoor air.

Mold in buildings can lead to allergy & asthma symptoms, respiratory ailments, and can cause eye, skin, and lung irritations, as well as headaches and fatigue.

Airborne dust and chemicals can play a critical role in aggravation of asthma and allergy symptoms.

Our unique Canary Air Quality monitor will measure the air in your home, office or other buildings to ensure the healthiest of environments for you and the occupants.

Canary will measure for:

- Carbon monoxide
- Carbon dioxide
- Airborne dust
- Airborne chemicals
- Humidity
- Temperature

After testing we will submit to you a comprehensive report detailing contaminant levels and recommendations for improvement.

To book an Air Quality test today, contact
